# Presentation Roadmap

- “Wrapping it up in a person”
- IRIS: A new approach to data about research
- Measuring impact on three time frames
- Questions & Discussion

RESEARCH INVESTMENT

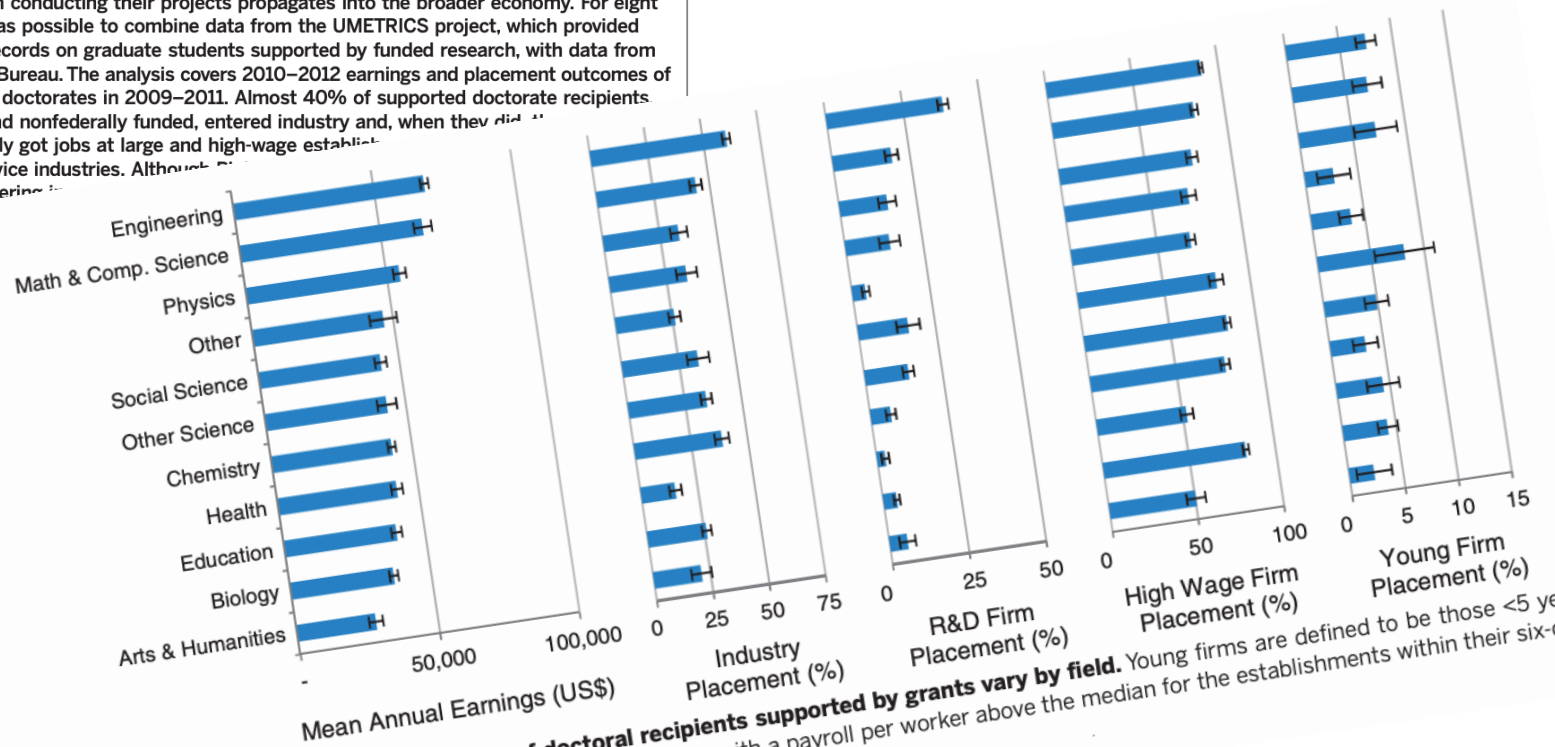

# Wrapping it up in a person: Examining employment and earnings outcomes for Ph.D. recipients

Nikolas Zolas,<sup>1</sup> Nathan Goldschlag,<sup>1</sup> Ron Jarmin,<sup>1</sup> Paula Stephan,<sup>2,3</sup>  
Jason Owen-Smith,<sup>4</sup> Rebecca F. Rosen,<sup>5</sup> Barbara McFadden Allen,<sup>6</sup>  
Bruce A. Weinberg,<sup>7,8,8\*</sup> Julia I. Lane<sup>1,5,8,9,10</sup>

In evaluating research investments, it is important to establish whether the expertise gained by researchers in conducting their projects propagates into the broader economy. For eight universities, it was possible to combine data from the UMETRICS project, which provided administrative records on graduate students supported by funded research, with data from the U.S. Census Bureau. The analysis covers 2010–2012 earnings and placement outcomes of people receiving doctorates in 2009–2011. Almost 40% of supported doctorate recipients both federally and nonfederally funded, entered industry and, when they did, disproportionately got jobs at large and high-wage establishments. Although there was some geographic clustering in research

“The best way to send information  
is to wrap it up in a person.”

**Fig. 3. The annual earnings and placement of doctoral recipients supported by grants vary by field.** Young firms are defined to be those <5 years old. High-payroll per worker establishments are defined as those with a payroll per worker above the median for the establishments within their six-digit industry. Means and standard errors (error bars) for each variable.

There is a well-documented gap between the observed number of women and by men in science, with clear consequences for the promotion of women<sup>1</sup>. The gap might be a result of bias that at least part of this gap is the result of bias in the way that research teams are significantly less likely to credit women. The findings are consistent across three sources—large-scale administrative data, a survey of attribution of credit—show that a gender gap in attribution is present across all stages. The second source—an extensive survey of women’s scientific contributions are systematically undercredited. The third source—qualitative responses—suggests that women are likely to be credited is because their work is often ignored. At least some of the observed gender gap is not due to differences in scientific contribution, but to differences in attribution.

A new way to approach the “missing millions”

# HOW IRIS OPERATES

# THE IRIS-UMETRICS DATASET

## 2022 Data Release

Over **535,000** funded awards at **80+** member campuses

**\$127 billion** in sponsored project spending

- More than 500 research users
- From 150+ institutions

About **\$31 billion** in payments to more than **970,000** vendors

*Data collected from IRIS member universities, FY 2001-21*

Wages to about **864,000** employees

# Three time frames for impact

## 1. Short term

- Grants allow investigators to hire the people and buy the stuff necessary to do research work – **Economic Stimulus**

## 2. Medium term

- Work on research teams helps educate highly skilled people who can apply cutting edge knowledge in new situations – **Wrapping it up in a person**

## 3. Long term

- New discoveries can generate technologies, businesses and sometimes entire industries - **Entrepreneurship**

# Short term stimulus

## The Impact of University of Michigan Research Spending on Michigan's 16th Senate District

Since 2015, externally funded University of Michigan research projects have purchased **goods and services worth \$776,000** from **38 businesses** and other organizations in Senate District 16.

**More than 2,600 residents** of the district are U-M graduates.

**More than 300 residents** of the district were enrolled at U-M for the 2020-21 school year.

Michigan Senate District 16 (Jackson, Branch and Hillsdale counties)

### Examples of the Economic & Social Impact of University of Michigan Research on District 16

MichiganWorks! Southeast is collaborating on a Summer Youth Employment Program led by U-M professor Luke Schaefer and funded by the Ralph C. Wilson Jr. Foundation. The \$60,000 subcontract provides youth with income, structured activities, college communities, mentors and on-the-job training.

The Community Action Network of Jackson County was awarded a \$124,000 subcontract on a clinical trial to test the effectiveness of behavioral interventions to address obesity in young children. The study was funded by the U.S. Department of Agriculture.

Coy Laboratory Products has supplied glove boxes — protective equipment for handling dangerous chemicals — to nearly 30 U-M labs. U-M projects, mostly funded through the National Institutes of Health, have provided contracts worth more than \$140,000 for the company over the past five years. Coy's relationship with U-M spans decades and has resulted in a dynamic and stable source of manufacturing employment. For a more detailed description of the company, see the next page.

**Overall, U-M's annual economic impact on Senate District 16 is more than \$135 million, according to the University Research Corridor.**

## Research Vendor Profile: Coy Laboratory Products

Coy Laboratory Products Incorporated, located in Grass Lake, Michigan (Jackson County) was founded in 1969 as a result of a collaboration between Richard Coy, owner of a small machining company and Dr. Rolph Freter, a U-M Microbiology professor.

"Together they developed the concept and design of the world's first anaerobic chamber dedicated to microbiology research." (<https://coylab.com/company/>).

Today the company manufactures a full line of related laboratory projects at its Grass Lake facility.

Data developed by the Institute for Research on Innovation and Science at the University of Michigan highlights the important role that those products play in scientific research and education around the country. Twenty-five major US research universities purchased nearly \$1.4 million of Coy products in the last five years.

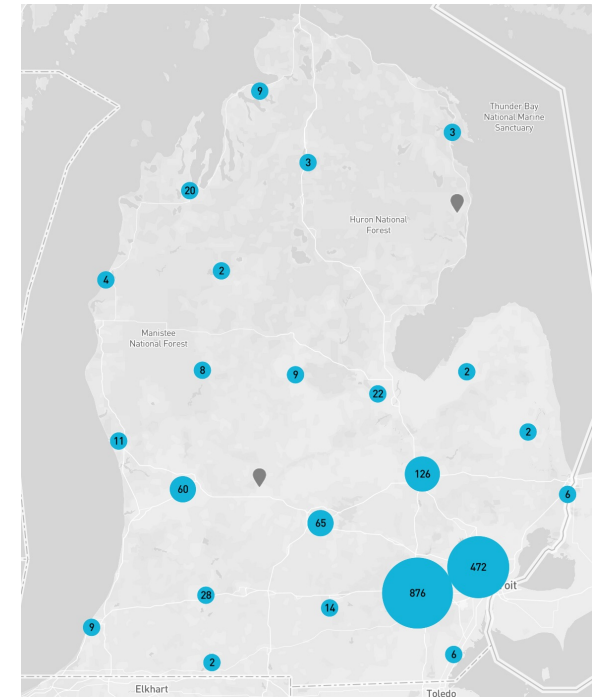

At the University of Michigan more than 30 externally funded projects use Coy products in their labs. Research tools developed and built in Jackson County also get used in introductory science courses through the University's "Authentic Research Connections" (<https://sites.lsa.umich.edu/arc/about/>) initiative. That project, funded by the Howard Hughes Medical Institute moves introductory undergraduate science classes "beyond the cookbook approach" of standard laboratory sections by bringing faculty research projects into the lab.

Collaborations between Coy and UM continued. The company's latest new product, a Mechanical Conflict-avoidance System, a novel approach to preclinical pain studies, "is a collaborative effort with the University of Michigan" (see [coylab.com](http://coylab.com) website).

**ABSTRACT**

A method assigns importance ranks to nodes in a linked database, such as any database of documents containing citations, the world wide web or any other hypermedia database. The rank assigned to a document is calculated from the ranks of documents citing it. In addition, the rank of a document is calculated from a constant representing the probability that a browser through the database will randomly jump to the document. The method is particularly useful in enhancing the performance of search engine results for hypermedia databases, such as the world wide web, whose documents have a large variation in quality.

# JOINING IRIS

## Members receive:

- Reports:
  - Vendor Profile Report
  - Spending Report
  - Government Relations Reports
  - Employee Report
  - Aggregate / Benchmarking Data
  - More...
- Access to the IRIS-UMETRICS dataset for researchers on your campus
- A voice in governance

## Members provide:

- Data from HR, procurement and sponsored projects twice a year
- Data contact and communications contact
- \$25,000 / year fee to maintain IRIS infrastructure and staff
